## **Experiments vs Tests**

### **Experiment**

- Often conducted at university, government, industrial research labs
- Difficult to do in a product development environment

### **Test**

- Performed on complex components (multistage, high speed)
- Conducted in industrial environment
- Essential component in a product development environment

## Impact of Experiments on Compressor Design

### **Path 1:**

Experimental data → improved CFD/analysis → improved design methods

### **Path 2:**

Experimental data → improved understanding → improved design/fab methods

## Analysis vs Experiment

Which is the Horse and which is the Cart?

### The 1980's

#### Emerging CFD

- 2D → 3D
- Inviscid → Viscous
- Steady → Unsteady

#### Emerging measurement methods

- Holography
- LDV

The ability to *calculate* within blade rows created a *drive* that fueled advancement of methods that could *measure* within blade rows

## **Analysis vs Experiment**

**Which is the Horse and which is the Cart?**

### **The 1990's**

**LDV data sets DLR, NASA**

- Rotors (steady)
- Stages (unsteady)

**Refined CFD methods**

- Turbulence models
- Grids & numerics
- Leakage models

The existence of high-quality, non-intrusive **data sets** enabled a **drive** for continued refinement of **CFD methods** and **best practices**

### Summary

*“Having a wind tunnel  
doesn’t tell you what to  
do with it.*

*Having a computer  
doesn’t tell you what to  
do with it.*

*The insight about what to  
do with a facility is the  
important thing.*

*And it is still a human  
insight.”*
